

JAVA MINI PROJECT

POOJA MART

From Java Code to Shopping

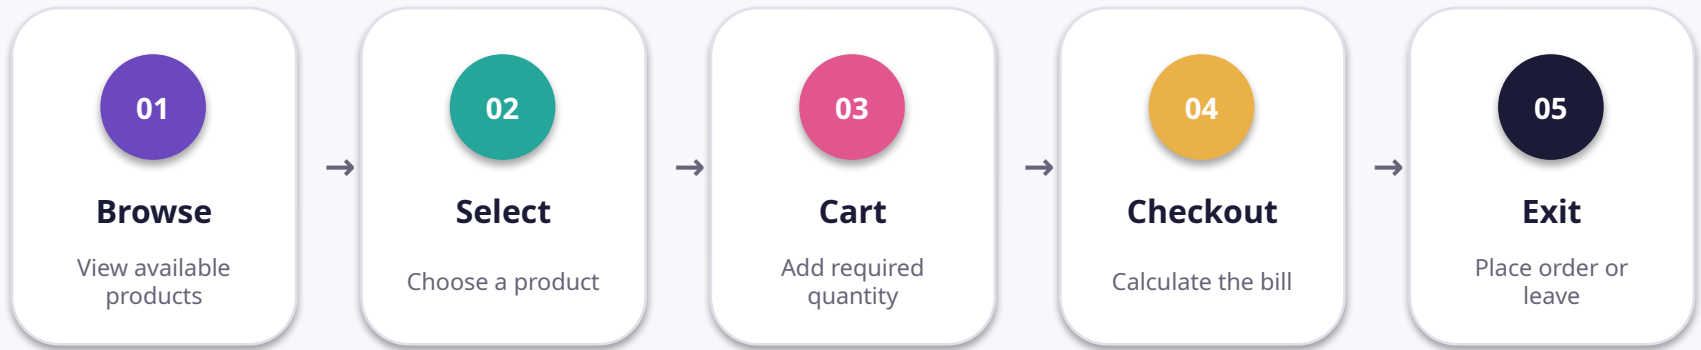

A Console-Based Shopping Application

Modernized presentation • clean visuals • new icon system

The Idea in One Picture

One simple program connects each step of a console shopping journey.

Meet the Product Class

Every item in Pooja Mart is represented as a Product object — storing its name and price.

LP

LAPTOP

Price

₹45,000

HP

HEADPHONE

Price

₹1,500

BG

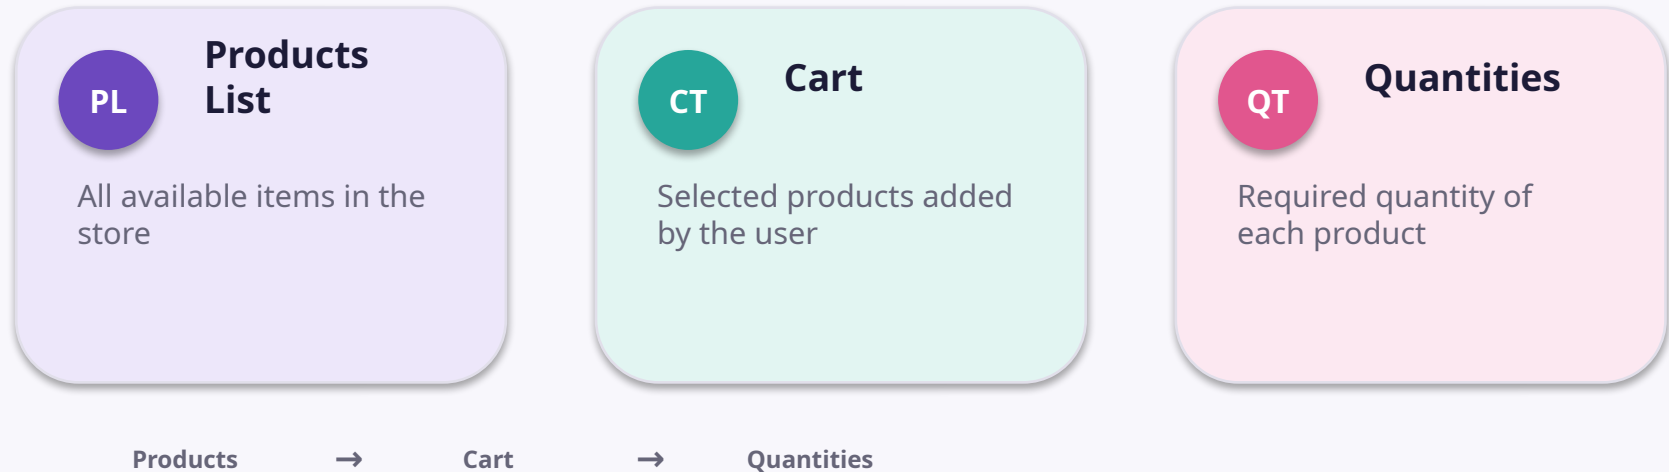

BAG

Price

₹1,200

Where Everything Is Stored

ArrayList helps the program manage collections dynamically.

The User Enters the System

Scanner connects the user's input with the Java program — reading choices directly from the console.

POOJA MART / CONSOLE

Enter product number: 2
Selected Product: Headphone
Price: ₹1,500
Enter quantity: 2

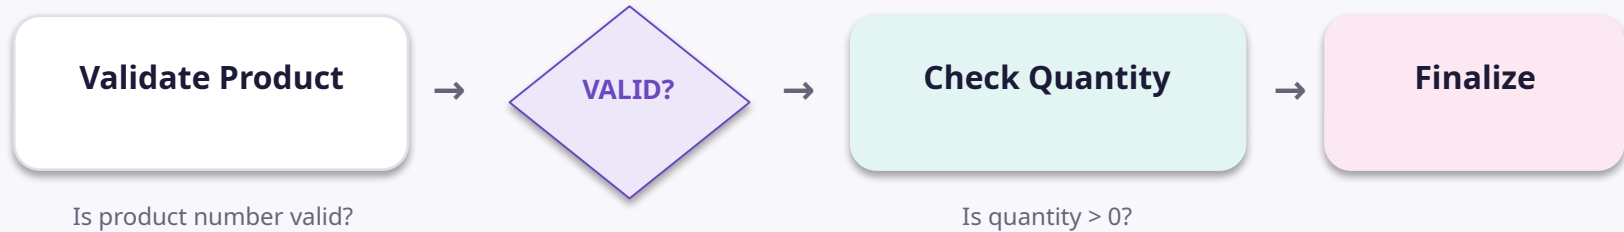

Added to Cart

2 × Headphone

The Program Makes a Decision

Conditional statements control the user's choices — validating every input before proceeding.

Invalid input → clear error message → user can try again.

The Shopping Loop

The loop allows the customer to continue shopping until an order is placed or the program is exited.

↺ Repeat until checkout or exit

When the Cart Becomes a Bill

Price × Quantity gives the item total — summed up to produce the final bill.

CT CART CONTENTS	
Laptop	× 1
Headphone	× 2
Bag	× 1

BILL CALCULATION	
₹45,000 × 1	₹45,000
₹1,500 × 2	₹3,000
₹1,200 × 1	₹1,200
GRAND TOTAL	₹49,200

Two Ending Points

The program always ends with a clear user decision.

OPTION 1

Place Order

Show Cart → Calculate Total → Confirm Purchase

ORDER PLACED ✓

OPTION 2

Exit

Close Program

THANK YOU

What We Built

Pooja Mart demonstrates how basic Java concepts can be combined to create a practical shopping application.
